

Introductions: name, year at Columbia, what you work on, briefly describe the research that you did in undergrad (just to give them a sense of how many projects you did and whether they were summer programs or more informal research)

Questions I'll have on deck (not everyone needs to answer every question):

1. How did you get started with undergrad research? (How did you look for opportunities? When did you start looking? What was your background going in?)
2. Tell us about one good undergrad research experience you had.
3. Tell us about one bad undergrad research experience you had.
4. How did you decide that you wanted to go to grad school? (What role did research play in that?)
5. What are your next steps/goals for after grad school? (How have these potentially changed since undergrad?)
6. What advice would you give to current undergrads who are just getting started in research? (Think about lessons you learned from your own experiences)
